

**DIGITIZATION OF GRANULAR RESOURCE DATA
INUVALUIT SETTLEMENT AREA**

Contract 87-0128

May 1990

**Inuvialuit Development Corporation
INUVIK, NWT**

Final Report

**DIGITIZATION OF GRANULAR RESOURCE DATA:
INUVELUIT SETTLEMENT AREA**

Contract No. 87-0138

May 1988

Prepared For:

**Government of Canada
Department of Indian Affairs and Northern Development**

Prepared By:

**Inuvialuit Development Corporation
Inuvik, NWT**

Table of Contents

Introduction	1
Scope of the Work	1
Granular Resource and Deposit Information	2
Spatial Deposit Information	6
Appendix I	9
Appendix II	13

This report details the work accomplished on Contract 87-0138.

SCOPE OF THE WORK

The terms of reference are:

- 1) review, summarize and check all available granular resource information for Inuvialuit and adjacent lands
- 2) compile using dBase III software, a granular database, which summarizes the non-graphic, geological and geotechnical information pertaining to granular deposits for the subject areas, in a standardized format which can be linked to the spatial database
- 3) prepare a loaded computerized spatial database on the ILA/PAMAP GIS which is linked to the descriptive resource deposit database and transferrable to the Department's database system
- 4) provide a series of computer-generated maps displaying the location of all granular resource deposits in the database and a series of appropriate query routines
- 5) prepare a report describing the work undertaken and the results of this study.

GRANULAR RESOURCE AND DEPOSIT INFORMATION

The granular information is in dBase III+ format and it is assumed that the user is at least familiar with its use. A menu-driven, user friendly program will be developed by ILA as, on the whole, their personnel are not familiar with dBase or any other database system. This will allow them to access, modify and update the database without having to learn dBase III. Their intention is also to develop query routines based on a combination of total volume, class of material and distance from a community from values provided by the user.

The database for this study consists of three parts:

- 1) IGRANCAT.DBF- catalogue of granular resource related field activities (as per Contract 87-0138 Attachment A)
- 2) IGRANDEP.DBF- northern granular resource deposit database (as per Contract 87-0138 Attachment B)
- 3) the exported information on the digitized deposits from the ILA/PAMAP GIS- named by Mapname and levelnumber and contains STUDY_NO and SOURCE_NO.

All three portions of the database are related by STUDY_NO with the last two related as well by SOURCE_NO. Currently the parts of the database are not indexed, although, ILA will likely index first by STUDY_NO and then by SOURCE_NO.

During a visit to Bob Gowan in early March, he provided the structure for both Attachment A and Attachment B databases. Changes have been made to the original structures of both but only in the length of some of the

variables. There was not sufficient time to review and revise in detail the format of either database. The structures of IGRANCAT and IGRANDEP are listed in Appendix I.

A list of the reports entered into the database is given in Appendix II. This covers the Inuvialuit Settlement Region and includes the majority of reports listed in the reference section of EBA Engineering 1987 Inuvialuit Sand & Gravel Inventory.

A system was devised to provide unique numbers for each report. For example: I77H-MS

I: Inuvialuit Settlement Region

77: year of the report

H: contractors Initials (eg. H=Hardy)

MS: alphanumeric indicating area, zone, number of sites or source (eg. MS=Many Sites).

In this way it was easier and required less space to cross-reference the sources in IGRANDEP. The number is given after each reference in Appendix II.

Because there are very few numeric or standardized alphanumeric variables, it is difficult to develop query routines for this database without involved programming. a few simple routines have been developed. For IGRANDEP, the first, and most obvious one, is related to the total volume. DP_VOLUM selects those sources with a volume greater than or equal to 500,000 m³.

Another series is based on the class of the granular material and on whether or not there is any data in a

particular class variable. DPCLASS1 selects those sources containing class 1 materials, DPCLASS2 those containing class 2 materials, DPCLASS3 those containing class 3 materials and DPCLASS4 those containing class 4 and 5 materials.

Remember that the effects of query routines are cumulative until another "USE" command is issued.

Other possible routines could be based on the granular type or location (latitude/longitude, UTM) variables. Any queries based on distances must first convert alphanumeric variables to numbers. This is especially involved when working with latitudes and longitudes which consist of 3 numeric portions separated by "-" followed by a letter designator. Each numeric portion would have to be broken out and stored. A program to determine the deposits within a given radius of a community will be developed as soon as possible.

No queries have been developed for IGRANCAT.

Once you have used a query to select a portion of the database, you can use a report file to print a copy of selected variables. Because of time constraints, none of the query or report formats developed are complex. Also, ILA does not possess an external report generator for dBase III.

Report files for IGRANCAT:

STUDY: brief information from the study catalogue-
STUDY_NO, YEAR, CONTRACTOR, STUDY_SCOP,
REPORT_LEVEL

ST_DESCR: description of the study- STUDY_NO,
STUDY_TYPE, STUDY_SCOP, SURV_LEVEL,
STUDY_SIZE, SEASON, EQUIP_TYPE.

Report files for IGRANDEP:

DEPOSIT: brief information on the tenure and status of
the deposit- STUDY_NO, SOURCE_NO, LND_TENURE,
STATUS.

DP_LOC: location coordinates for the centre of the
deposit- STUDY_NO, SOURCE_NO, NTS_REF, LAT,
LONG, UTM_EAST, NORTHING, AREA, TOTAL_VOLU.

DP_SITE: description of surroundings- STUDY_NO,
SOURCE_NO, TOPOGRAPHY, SLOPE, VEGETATION,
GENERIC_OR, LANDFORM.

DP_STRAT: stratigraphy of the deposit- STUDY_NO,
SOURCE_NO, OVRBURD_TP, OVRBURD_TH, GRANULR_TP,
GRANULR_TH, UNDRBUR_TP.

DP_ACCEES: description of access to the deposit-
STUDY_NO, SOURCE_NO, COR_NO_NAM, KILO_POST,
OFST_DS_DR, AREA, ACCESS, DISTANCE, CONDITION.

DP_REFER: reference list for the deposit- STUDY_NO,
SOURCE_NO, X_REF.

DP_CLASS: amounts of the various classes of materials-
STUDY_NO, SOURCE_NO, AREA, CLASS_1, CLASS_2,
CLASS_3, CLASS_4, CLASS_5, TOTAL_VOLU.

All but 2 of these formats (DEPOSIT and DP_LOC) require paper wider than 8 1/2" to print the selected portion of the record or the use of compressed pitch if it is available on the printer. A number of view files have been developed to look at (and print) certain combinations of variables. To keep things organized, view and report files which use the same variables have the same names.

Three copies of IGRANCAT.DBF and IGRANDEP.DBF and their related files on 1.2 Mb floppy disks are submitted. Also, fifteen printed copies of selected portions of the database.

SPATIAL DEPOSIT INFORMATION

Digitization of the spatial database has been completed for the mainland, Banks Island and Victoria Island. Because some of the mainland deposits are described in more than one report, there exist duplicate spatial records. The most recent deposit descriptions are on one level, level 5, with earlier descriptions on another, level 7. If necessary, a third description is on level 11. The ILA/PAMAP GIS is capable of handling them

individually or as a composite. The spatial database exists as 4 maps:

- | | |
|-------------------|--------------------------|
| 1) Delta mainland | Map Name- GRANULAR |
| | SW Corner- 68°N 138°W |
| | NE corner- 70°N 132°W |
| 2) Paulatuk | Map Name- PAULGRAN |
| | SW Corner- 69°N 125°W |
| | NE corner- 69°45'N 123°W |
| 3) Sachs Harbour | Map Name- SCHSGRAN |
| | SW Corner- 71°N 126°W |
| | NE corner- 72°15'N 124°W |
| 4) Holman | Map Name- HLMNGRAN |
| | SW Corner- 70°15'N 119°W |
| | NE corner- 71°N 117°W |

Each deposit has a unique PAMAP GIS 'polytag' identifier as well as a STUDY_NO/SOURCE_NO combination. This information can be exported from the GIS to dBASE III+, accessed by a filename consisting of map_name_level_number and related to IGRANCAT and IGRANDEP.

The spatial information is in PAMAP GIS format which can easily be converted to ARC/Info or INTERGRAPH format. A copy of the maps on 1.2 Mb floppy disk is submitted. If necessary, ILA will have PAMAP in Victoria convert them to a format usable by DIAND.

Unfortunately there has been insufficient time to discuss with Departmental representatives the specifics of the scales and contents of the maps they want provided. A series of maps showing the deposits of each area at 1:250,000 scale are submitted.

The deposit information has been merged with the base map of the area to verify the accuracy of the digitizing and its correspondence with the maps in EBA Engineering 1987. For ILA use, a map at scale 1:500,000 will be printed which includes most of the mainland deposits within the Inuvialuit Settlement Region. Again, the development of a menu-driven system by ILA will allow them to plot maps at user provided scales and contents. The ILA digitizer will be attending a course at PAMAP in mid-June and will determine how to plot the deposits directly onto 1:250,000 scale NTS mapsheets, and perhaps 1:50,000 NTS.
